

# SLIP39 macOS App

Perry Kundert

2022-02-02 22:22:00

Creating Ethereum, Bitcoin and other accounts is complex and fraught with potential for loss of funds.

All Crypto wallets start with a "Seed": a large, random number used to generate all of the actual Bitcoin, Ethereum, etc. wallets.

The best practice for using these wallets is to load this "Seed" into a secure hardware device, like a Trezor hardware wallet. SLIP39 Mnemonic cards contain the recovery words, which are typed directly into the Trezor device to recover the Seed, and all of its accounts.

The macOS SLIP39 app helps you generate Mnemonic cards and back up this seed, securely and reliably, by distributing Mnemonic cards for the seed to partners, family and friends.

Later, if you (or your heirs!) need to recover the accounts, they can collect a sufficient threshold of the cards and regain access to the account.

2.1	Trezor . . . . .	3

## 1 Security with Availability

For both BIP-39 and SLIP-39, a 128-bit or 256-bit random "Seed" is the source of an unlimited sequence of Ethereum HD Wallet accounts. Anyone who can obtain this Seed gains control of all Ethereum, Bitcoin (and other) accounts derived from it, so it must be securely stored.

## **2    Affiliate Links**

To assist you in obtaining various SLIP39 compatible components, we have established some relationship with reliable vendors.

### **2.1    Trezor**

The Trezor Model T hardware wallet has built-in SLIP39 generation and recovery capability.
